  TITLE     Direct Submission
  JOURNAL   Submitted (11-OCT-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Oct 9, 2002 this sequence version replaced gi:21671609.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

  TITLE     Direct Submission
  JOURNAL   Submitted (23-NOV-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Nov 23, 2002 this sequence version replaced gi:24796686.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

COMMENT
            Sequence Produced by Berkeley PGA
            Web site: http://pga.lbl.gov
            Center Code: PGABERK
            Center Project Name: L148-91K12
            Bac Clone Name: LB2-91K12

            This sequence has been compared to sequences of other species
            using Vista (http://www-gsd.lbl.gov/VISTA). The results can be
            viewed at:
            http://pga.lbl.gov/cgi-bin/search_cvcgd?type=n&value=CYP7A1

            The order-orientation of the draft sequence was accomplished by
            using:
            Avid (http://baboon.math.berkeley.edu/mavid) and paired end
            information.

            Funding agent: Programs for Genomic Applications (NHLBI)

            If the Bac Library Name is LB1 to LB4, please see website
            for the description: http://www-gsd.lbl.gov/cheng/BAC.html
            These libraries are available through the BACPAC Resources Center:
            http://www.chori.org/bacpac/libraryres.htm as LBNL-1 to LBNL-4.

            Summary Statistics:
            Sequencing vector: Plasmid; pUC18
            Chemistry: Dye-terminator Big Dye
            Assembly program: Phrap version 0.990329.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 9 contigs. Gaps between the contigs
            * are represented as runs of N. The order of the pieces
            * is believed to be correct as given, however the sizes
            * of the gaps between them are based on estimates that have
            * provided by the submittor.
            * This sequence will be replaced
            * by the finished sequence as soon as it is available and
            * the accession number will be preserved.

  TITLE     Direct Submission
  JOURNAL   Submitted (19-NOV-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Nov 19, 2002 this sequence version replaced gi:22953920.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

  TITLE     Direct Submission
  JOURNAL   Submitted (20-NOV-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Nov 20, 2002 this sequence version replaced gi:23665065.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.
            -------------- Genome Center

            -------------- Project Information
                Center project name: KAJE
                Center clone name: CH230-262L8
            -------------- Summary Statistics
                Assembly program: Phrap; version 0.990329
                Consensus quality: 193410 bases at least Q40
                Consensus quality: 198067 bases at least Q30
                Consensus quality: 201676 bases at least Q20
                Estimated insert size: 196651; sum-of-contigs estimation
                Quality coverage: 5x in Q20 bases; sum-of-contigs estimation
            --------------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 3 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *         1   245348: contig of 245348 bp in length
            *    245349   245448: gap of unknown length
            *    245449   246558: contig of 1110 bp in length
            *    246559   246658: gap of unknown length
            *    246659   247726: contig of 1068 bp in length.

  TITLE     Direct Submission
  JOURNAL   Submitted (09-MAY-2003) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On May 9, 2003 this sequence version replaced gi:24941016.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

COMMENT     On Sep 14, 2002 this sequence version replaced gi:21908639.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

  TITLE     Direct Submission
  JOURNAL   Submitted (20-NOV-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Nov 20, 2002 this sequence version replaced gi:23267584.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

  JOURNAL   Cell 39 (2 Pt 1), 417 (1984)
   PUBMED   6094018
COMMENT     Original source text: Maize DNA, clone Ac wx-m9.
            [2]  revises [1].
            The ends of the Ac9 element comprise an 11 bp imperfect terminal
            repetition and the insertion site within the wx locus is flanked by
            an 8 bp directly repeated sequence.

            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep WAG-112A23 is

            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 4 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1    43829: contig of 43829 bp in length
            *    43830    44029: gap of unknown length
            *    44030    87202: contig of 43173 bp in length
            *    87203    87402: gap of unknown length
            *    87403    94824: contig of 7422 bp in length

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-24 BAC Library has been constructed by Pieter de Jong and
            coworkers (http://www.chori.org) from male C57BL/6J mouse spleen
            and/or brain genomic DNA. The clone and detailed information can be
            obtained from Pieter de Jong and coworkers at http://www.chori.org

            NEIGHBORING SEQUENCE INFORMATION:
            This sequence is the entire insert of the clone.

COMMENT     On May 10, 2003 this sequence version replaced gi:22855236.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

            --------------.

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa
            and Minako Tateno in the laboratory of Pieter de Jong
            (http://www.chori.org) from female C57BL/6J mouse kidney and/or
            brain genomic DNA.  The clone and detailed information can be
            obtained from Research Genetics, Inc. (http://www.resgen.com) or
            Pieter de Jong and coworkers at http://www.chori.org

            NEIGHBORING SEQUENCE INFORMATION:
            This sequence is the entire insert of the clone.

            -------------- Summary Statistics
                Center project name: M_BA0107E14
            --------------.

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa

COMMENT     On Apr 2, 1999 this sequence version replaced gi:4337173.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 3 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1    47631: contig of 47631 bp in length
            *    47632    47831: gap of unknown length
            *    47832   179129: contig of 131298 bp in length
            *   179130   179329: gap of unknown length
            *   179330   196149: contig of 16820 bp in length.

            ------------- Genome Center
                Center: Washington University Genome Sequencing Center
                Center code: WUGSC
                Web site: http://genome.wustl.edu
                Contact: submissions@watson.wustl.edu
            ------------- Summary Statistics
                Center project name: M_BA0124A12
            -------------.

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa
            and Minako Tateno in the laboratory of Pieter de Jong
            (http://www.chori.org) from female C57BL/6J mouse kidney and/or
            brain genomic DNA.  The clone and detailed information can be
            obtained from Research Genetics, Inc. (http://www.resgen.com) or
            Pieter de Jong and coworkers at http://www.chori.org

            NEIGHBORING SEQUENCE INFORMATION:
            This sequence is the entire insert of the clone.

COMMENT     On Sep 14, 2002 this sequence version replaced gi:21671638.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
```

(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

---------- Project Information
Center project name: GTUK
Center clone name: CH230-290F24
---------- Summary Statistics
Assembly program: Phrap; version 0.990329
Consensus quality: 199476 bases at least Q40
Consensus quality: 202697 bases at least Q30
Consensus quality: 204497 bases at least Q20
Estimated insert size: 220130; sum-of-contigs estimation
Quality coverage: 3x in Q20 bases; sum-of-contigs estimation
----
* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 4 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
* 1 209764: contig of 209764 bp in length
* 209765 209864: gap of unknown length
* 209865 210963: contig of 1099 bp in length
* 210964 211063: gap of unknown length
* 211064 212266: contig of 1203 bp in length
* 212267 212366: gap of unknown length
* 212367 215675: contig of 3309 bp in length.

---------- Summary Statistics
Center project name: M_BA0279A02

NOTICE:

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e. phred quality >=30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone, fosmid clone or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The assembly was confirmed by restriction digest.
This finishing standard has slightly changed from the previous Human standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is minimal.
If a sequence meets the criteria of the above statement, it needs no comments or tags. If the criteria are not met, such as ambiguous bases, then the region is duly annotated.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see

```
          http://genome.wustl.edu

          SOURCE INFORMATION:
          The  BAC Library has been constructed by Kazutoyo Osegawa and
          Minako Tateno in the laboratory of Pieter de Jong
          (http://www.chori.org) from female C57BL/6J mouse kidney and/or
          brain genomic DNA.  The clone and detailed information can be
          obtained from Research Genetics, Inc. (http://www.resgen.com) or
          Pieter de Jong and coworkers at http://www.chori.org

          This sequence is the entire insert of the clone.

  TITLE     Direct Submission
  JOURNAL   Submitted (09-NOV-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Nov 9, 2002 this sequence version replaced gi:22773052.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

                Contact: hgsc-help@bcm.tmc.edu
            -------------- Project Information
                Center project name: GDCJ
                Center clone name: CH230-5C3
            -------------- Summary Statistics
                Assembly program: Phrap; version 0.990329
                Consensus quality: 234755 bases at least Q40
                Consensus quality: 236298 bases at least Q30
                Consensus quality: 237126 bases at least Q20
                Estimated insert size: 242830; sum-of-contigs estimation
                Quality coverage: 7x in Q20 bases; sum-of-contigs estimation
            --------------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 1 contigs. Gaps between the contigs
            * are represented as runs of N. The order of the pieces
            * is believed to be correct as given, however the sizes
            * of the gaps between them are based on estimates that have
            * provided by the submittor.
            * This sequence will be replaced
            * by the finished sequence as soon as it is available and
            * the accession number will be preserved.
            *       1   241828: contig of 241828 bp in length.

  TITLE     Direct Submission
  JOURNAL   Submitted (13-NOV-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Nov 13, 2002 this sequence version replaced gi:23322421.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.
            -------------- Genome Center
                Center: Baylor College of Medicine
                Center code: BCM

                Contact: hgsc-help@bcm.tmc.edu
            -------------- Project Information
                Center project name: TUNZ
                Center clone name: CH230-2C20
            -------------- Summary Statistics
                Assembly program: Phrap; version 0.990329
                Consensus quality: 210771 bases at least Q40
                Consensus quality: 220796 bases at least Q30
                Consensus quality: 226806 bases at least Q20
                Estimated insert size: 204716; sum-of-contigs estimation
                Quality coverage: 4x in Q20 bases; sum-of-contigs estimation
            --------------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 25 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.

COMMENT     On Jan 27, 1998 this sequence version replaced gi:2689462.
            Sequencing is completed to a minimum standard of double strand
            coverage with a minimum of 2 clones and 2 reads with no ambiguities
            or 2 chemistries with a minimum of 2 clones and 3 reads with no
            ambiguities. If the sequence quality does not meet this standard,
            it will be indicated in the annotation.

            The repeat regions shown were identified using RepeatMasker by
            Adrian Smit.

            Sequence similarities were identified using Powerblast by Jinghui
            Zhang.

            Exon/Intron boundaries of identified genes were chosen if there
            were canonical splice junctions that maintained sequence continuity
            across the splice junctions.

            ------------------------------------------------.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 12 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     1412: contig of 1412 bp in length
            *     1413     1512: gap of unknown length
            *     1513     3280: contig of 1768 bp in length
            *     3281     3380: gap of unknown length

            ---------- Summary Statistics
                Sequencing clone based: pUC18; 82% of reads
                Whole genome shotgun: 18% of reads
                Chemistry: Dye-terminator Big Dye; 100% of reads
                Assembly program: Phrap; version 0.990329
                Consensus quality: 194442 bases at least Q40
                Consensus quality: 194447 bases at least Q30
                Consensus quality: 194447 bases at least Q20
                Quality coverage: 12.99x
            ----------
            This sequence was finished with the support of external Whole
            genome shotgun data (http://www.ncbi.nlm.nih.gov/Traces/trace.fcgi)
            as follows unless otherwise noted: all regions were double
            stranded, sequenced with an alternate chemistry, or covered by high
            quality data (i.e., phred quality >= 30); an attempt was made to
            resolve all sequencing problems, such as compressions and repeats;
            all regions were covered by at least one plasmid subclone or more
            than one M13 subclone; and the assembly was confirmed by
            restriction digest.
            ----------
            Neighboring sequence information:
            This clone is overlapped by PTB-085O24.
            ----------
            Source information:
            The PTB1 chimpanzee BAC library was prepared from DNA isolated
            from cultured cells established from the blood of a single male
            chimpanzee. The clone may be obtained from Asao Fujiyama and
            co-workers (http://www.gsc.riken.go.jp).
            VECTOR:  pKS145
            ----------
            Sequence Quality Assessment:
             This entry has been annotated with sequence quality
             estimates computed by the Phrap assembly program.
             All manually edited bases have been reduced to quality zero.
             Quality levels above 40 are expected to have less than
```

```
            1 error in 10,000 bp.
            Base-by-base quality values are not generally visible from the
            GenBank flat file format but are available as part
            of this entry's ASN.1 file.

          Primer A: None
          Primer B: None
          STS size: 467
          Protocol:
          WGS-discovery: Paired-end low-coverage whole genome shotgun reads
          were generated from 129S1/SvImJ, C3H/HeJ, and BALB/cByJ. The WGS
          reads were placed uniquely on the MGSCv3 C57BL/6J assembly and SNP
          detection was carried out by SSAHA-SNP. 225,000 reads were
          annotated
          as STSs and 81,000 SNPs were annotated with alleles from C57BL/6J
          and the strain from which the particular read came. The validation
          rate for these SNPs was estimated at approximately 98%.

  TITLE     Direct Submission
  JOURNAL   Submitted (14-JUN-2002) Berkeley Drosophila Genome Project,
            Lawrence Berkeley National Laboratory, One Cyclotron Road,
            Berkeley, CA 94720, USA
COMMENT     Sequence submitted by:
            Berkeley Drosophila Genome Project
             Lawrence Berkeley National Laboratory
            Berkeley, CA 94720
             This clone was sequenced as part of a high-throughput process to
            sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
            Science 2000). The sequence has been subjected to integrity checks
            for sequence accuracy, presence of a polyA tail and contiguity
            within 100 kb in the genome. Thus we believe the sequence to
            reflect accurately this particular cDNA clone. However, there are
            artifacts associated with the generation of cDNA clones that may
            have not been detected in our initial analyses such as internal
            priming, priming from contaminating genomic DNA, retained introns
            due to reverse transcription of unspliced precursor RNAs, and
            reverse transcriptase errors that result in single base changes.
            For further information about this sequence, including its location
            and relationship to other sequences, please visit our Web site
            (http://fruitfly.berkeley.edu) or send email to
            cdna@fruitfly.berkeley.edu.

TITLE Direct Submission
JOURNAL Submitted (18-JAN-2002) MIPS, Institut fuer Bioinformatik, GSF-Forschungszentrum fuer Umwelt und Gesundheit, GmbH, Ingolstaedter Landstrasse 1, D-85764 Neuherberg, FRG, E-mail: G.Mannhaupt@gsf.de Project Coordinator: Ulrich Schulte, Institute of Biochemistry, Heinrich-Heine-University, D-40225 Duesseldorf, E-mail: ulrich-schulte@uni-duesseldorf.de
COMMENT BAC clone 12N19 (strain OR74A) is available at the Fungal Genetic Stock Center, http://www.fgsc.net
Sequencing was performed by MWG Biotech AG, Ebersberg, Germany, http://www.mwgdna.com
Information on performance of analysis and a more detailed annotation of this entry and other sequences of linkage groups II and V can be viewed at: http://mips.gsf.de/proj/neurospora.

COMMENT     Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University
                  St. Louis , MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 IRQ, England
                  email: submissions@watson.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted: all
            regions were double stranded, sequenced with an alternate chemistry
            or covered by high quality data (i.e., phred quality >= 30); an
            attempt was made to resolve all sequencing problems, such as
            compressions and repeats; all regions were covered by sequence from
            more than one m13 subclone.

            For a graphical representation of this clone sequence and its
            analysis see:
            http://www.wormbase.org/db/seq/sequence?name=Y40C5A;class=Sequence

                        NEIGHBORING CLONE INFORMATION

            The 5' clone is F42C5, 400 bp overlap; the 3' clone is T12B3, 200
            bp overlap. Actual start of this clone is at base position 17680 of
            C06E4; actual end is at 5974 of F55G1.

            NOTES:

            Coding seqences below are the result of integration and manual
            review of the following data : computer analysis using the program
            Genefinder (P. Green and L. Hillier, personal communication), the
            large scale EST projects of Yuji Kohara
            (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C.

COMMENT     BAC clone RPCI93-30K1 from Trypanosoma brucei chromosome 8.
            Putative protein coding regions (>30 codons) were predicted by
            combining the output of the gene finding algorithm GLIMMER with
            similarity data and manual annotation of open reading frames.
            Further refinement of gene models (additions, deletions and
            alterations to boundary coordinates) were done manually based on
            detailed comparisons with the T. cruzi and L. major genomes. Genes
            on BACs were assigned a systematic name based on the chromosome and
            the BAC from which they originated (e.g. Tb03.27F10.410). Gene
            products were assigned a putative function when they shared
            significant similarity with experimentally characterized gene
            products or when they contained functionally known protein domains.
            Gene products were labelled either 'hypothetical protein', or
            'hypothetical protein, conserved' in the case of products showing
            significant similarity with proteins or domains of unknown function
            from other organisms. Gene products of unknown function with
            predicted orthologs in Trypanosoma cruzi and Leishmania major
            genomes were automatically classified as conserved proteins. Short
            predicted coding sequences (less than 150 codons) with no
            additional evidence of coding potential were labelled 'hypothetical
            protein, unlikely'.

COMMENT     On Jul 21, 2005 this sequence version replaced gi:67514468.
            -------------- Genome Center
            Center: Wellcome Trust Sanger Institute
            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: zfish-help@sanger.ac.uk
            --------------
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one subclone; and the assembly was confirmed by restriction digest,
            except on the rare occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep
            Clone-derived Zebrafish pUC subclones occasionally display
            inconsistency over the length of mononucleotide A/T runs and
            conserved TA repeats. Where this is found the longest good quality
            representation will be submitted.
            Any regions longer than 1kb tagged as misc-feature 'unsure' are
            part of a tandem repeat of more than 10kb in length where it has
            not been possible to anchor the base differences between repeat
            copies.  The region has been built up based on the repeat element
            to match the total size of repeat indicated by restriction digest,
            but repeat copies may not be in the correct order and the usual
            finishing criteria may not apply.
            CH211-250B7 is from a CHORI-211 BAC library
            VECTOR: pTARBAC2.1.

            --------------.

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-11 human BAC library was made from the blood of one male
            donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E.,
            Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved
            approach for construction of bacterial artificial chromosome
            libraries. Genomics 51:1-8. The clone may be obtained either from
            Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong
            and coworkers at http://www.chori.org
            VECTOR:  pBACe3.6

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is RP11-473L20; the clone sequenced
            to the right is RP11-485M18, 2000 bp overlap.  Actual start of this
            clone is at base position 1 of RP11-680O16; actual end is at base
            position 36903 of RP11-485M18.

            The sequence between 103323 and 103663 is covered only by a pcr
            product of clone DNA. Single stranded region exists between 103323
            and 103594. Data from AC073989 was used to finish this clone,
            AC064874.

  TITLE     Direct Submission
  JOURNAL   Submitted (07-APR-2005) The Institute for Genomic Research, 9712
            Medical Center Dr, Rockville, MD 20850, USA, nelsayed@tigr.org
COMMENT     BAC clone RPCI93-11J15 from Trypanosoma brucei chromosome 8.
            Putative protein coding regions (>30 codons) were predicted by
            combining the output of the gene finding algorithm GLIMMER with
            similarity data and manual annotation of open reading frames.
            Further refinement of gene models (additions, deletions and
            alterations to boundary coordinates) were done manually based on
            detailed comparisons with the T. cruzi and L. major genomes. Genes
            on BACs were assigned a systematic name based on the chromosome and
            the BAC from which they originated (e.g. Tb03.27F10.410). Gene
            products were assigned a putative function when they shared
            significant similarity with experimentally characterized gene
            products or when they contained functionally known protein domains.
            Gene products were labelled either 'hypothetical protein', or
            'hypothetical protein, conserved' in the case of products showing
            significant similarity with proteins or domains of unknown function
            from other organisms. Gene products of unknown function with
            predicted orthologs in Trypanosoma cruzi and Leishmania major
            genomes were automatically classified as conserved proteins. Short
            predicted coding sequences (less than 150 codons) with no
            additional evidence of coding potential were labelled 'hypothetical
            protein, unlikely'.

            -------------- Summary Statistics
                Center project name: M_BA0074A08
            --------------.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa
            and Minako Tateno in the laboratory of Pieter de Jong
            (http://www.chori.org) from female C57BL/6J mouse kidney and/or
            brain genomic DNA.  The clone and detailed information can be
            obtained from Research Genetics, Inc. (http://www.resgen.com) or
            Pieter de Jong and coworkers at http://www.chori.org

            NEIGHBORING SEQUENCE INFORMATION:
            This sequence is the entire insert of the clone. This clone is
            overlapped by AC125109.

AL683804
LOCUS       AL683804              198631 bp    DNA     linear   ROD 09-FEB-2005
DEFINITION  Mouse DNA sequence from clone RP23-17F2 on chromosome 1 Contains  a
            SEC61 gamma subunit (Sec61g) pseudogene, a limb expression 1
            homolog (chicken) (Lix1) pseudogene, a novel pseudogene, the 5' end
            of the gene for an ortholog of human Ras association (RalGDS/AF-6)
            and pleckstrin homology domains 1 RAPH1 and a CpG island, complete
            sequence.

  TITLE     Direct Submission
  JOURNAL   Submitted (04-FEB-2005) Wellcome Trust Sanger Institute, Hinxton,
            Cambridgeshire, CB10 1SA, UK. E-mail enquiries: vega@sanger.ac.uk
            Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Oct 24, 2002 this sequence version replaced gi:24210306.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep --------------
            Genome Center
            Center: Wellcome Trust Sanger Institute
            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: vega@sanger.ac.uk
            --------------
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one subclone; and the assembly was confirmed by restriction digest,
            except on the rare occasion of the clone being a YAC.
            Sequence from the Mouse Genome Sequencing Consortium whole genome
            shotgun may have been used to confirm this sequence.  Sequence data
            from the whole genome shotgun alone has only been used where it has
            a phred quality of at least 30.
            RP23-17F2 is from the RPCI-23 Mouse BAC Library
            constructed by the group of Pieter de Jong.
            For further details see http://www.chori.org/bacpac/home.htm

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 1 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *       1   199917: contig of 199917 bp in length.

            -------------- Summary Statistics
                Center project name: M_BB0322F04
            --------------.

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-24 BAC Library has been constructed by Pieter de Jong and
            coworkers (http://www.chori.org) from male C57BL/6J mouse spleen
            and/or brain genomic DNA. The clone and detailed information can be
            obtained from Pieter de Jong and coworkers at http://www.chori.org

            NEIGHBORING SEQUENCE INFORMATION:
            This sequence is the entire insert of the clone.

  TITLE     Direct Submission
  JOURNAL   Submitted (10-MAY-2003) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On May 10, 2003 this sequence version replaced gi:24953284.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

  TITLE     Direct Submission
  JOURNAL   Submitted (13-NOV-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Nov 13, 2002 this sequence version replaced gi:22773148.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.
            -------------- Genome Center
                Center: Baylor College of Medicine
                Center code: BCM
                Web site: http://www.hgsc.bcm.tmc.edu/
                Contact: hgsc-help@bcm.tmc.edu
            -------------- Project Information
                Center project name: GDDG
                Center clone name: CH230-9K13
            -------------- Summary Statistics
                Assembly program: Phrap; version 0.990329
                Consensus quality: 221551 bases at least Q40
                Consensus quality: 223436 bases at least Q30
                Consensus quality: 224655 bases at least Q20
                Estimated insert size: 229610; sum-of-contigs estimation
                Quality coverage: 8x in Q20 bases; sum-of-contigs estimation
            --------------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 1 contigs. Gaps between the contigs
            * are represented as runs of N. The order of the pieces
            * is believed to be correct as given, however the sizes
            * of the gaps between them are based on estimates that have
            * provided by the submittor.
            * This sequence will be replaced
            * by the finished sequence as soon as it is available and
            * the accession number will be preserved.
            *       1   238494: contig of 238494 bp in length.

  TITLE      Direct Submission
  JOURNAL    Submitted (12-MAR-2003) Genome Analysis, Institute of Molecular
             Biotechnology, Beutenberstr. 11, Jena 07745, Germany
COMMENT      On or before Mar 4, 2003 this sequence version replaced
             gi:20066269, gi:19920061, gi:19919989.
             CDS predictions from GeneID do not necessarily reflect true genes.
             Further Information is available from IMB Jena, Department of
             Genome Analysis

  TITLE     Direct Submission
  JOURNAL   Submitted (09-MAY-2003) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On May 9, 2003 this sequence version replaced gi:24818467.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

```
            Consensus quality: 245833 bases at least Q30
            Consensus quality: 247014 bases at least Q20
            Estimated insert size: 254075; sum-of-contigs estimation
            Quality coverage: 7x in Q20 bases; sum-of-contigs estimation
          --------------
          * NOTE: Estimated insert size may differ from sequence length
          *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)
          * NOTE: This sequence may represent more than one clone.
          * NOTE: This is a 'working draft' sequence. It currently
          * consists of 2 contigs. The true order of the pieces
          * is not known and their order in this sequence record is
          * arbitrary. Gaps between the contigs are represented as
          * runs of N, but the exact sizes of the gaps are unknown.
          * This record will be updated with the finished sequence
          * as soon as it is available and the accession number will
          * be preserved.
          *        1   243433: contig of 243433 bp in length
          *   243434   243533: gap of unknown length
          *   243534   254816: contig of 11283 bp in length.

  TITLE     Direct Submission
  JOURNAL   Submitted (11-MAR-2002) Ceres, Inc, 3007 Malibu Canyon Road,
            Malibu, CA 90265, USA
COMMENT     This clone sequence is one of 5,000 Ceres full-length cDNAs made
            available to TIGR and Genbank. The following quality assessment of
            this set was done by comparison with known proteins: two percent of
            the clones are estimated to be 5'-truncated; less than one percent
            are 3'-truncated; approximately two percent represent alternative
            splice variants, including unspliced introns and spliced exons; one
            percent may contain premature stop codons; five percent may have
            frame shifts in a coding region. A sequence is considered to be
            5'-truncated if it lacks the translation initiation start (ATG). A
            sequence is considered to be 3'-truncated if it lacks the
            C-terminal end of the encoded protein. Please note that these cDNA
            sequences are derived from the Ws or LAer ecotypes and therefore
            may contain polymorphisms when compared to sequences from Col-0.
            Genset carried out the library production and sequencing of the
            full-length clones. Ceres, Inc. carried out the clustering of the
            5' sequences, selection of clones, and sequence assembly.

          This is the finished sequence of clone BACN4L24.  The CDSs
          presented here are only preliminary predictions based on automatic
          analysis. Analysis of the sequence is in progress.
          Clone=BACN4L24; Contig ID=0; Length=71813; Status=Finished.

COMMENT     Address for correspondence: kaos@kazusa.or.jp
            For the latest information on annotation of this clone, please see
            http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=MNF13
            Genes with similarity to proteins in the databases are described in
            'product' or 'note' qualifiers.  Genes that have no significant
            protein similarity are described as 'unknown protein'.
            The software programs used to predict genes include: Grail
            (Informatics Group, Oak Ridge National Laboratory,
            http://compbio.ornl.gov/Grail-1.3/),
            GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
            NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
            Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
            SplicePredictor (Volker Brendel, Stanford University,
            http://gremlin1.zool.iastate.edu/cgi-bin/sp.cgi).
            Genes encoding tRNAs are predicted by tRNAscan-SE
            (Sean Eddy, Washington University School of Medicine, St. Louis,
            http://genome.wustl.edu/eddy/tRNAscan-SE/).
            This sequence may not be the entire insert of this clone. It may be
            shorter because we remove overlaps between neighboring submissions.
            The 5' clone is K21I16 and the 3' clone is K1B16.

JOURNAL Submitted (12-MAR-2003) Genome Analysis, Institute of Molecular Biotechnology, Beutenberstr. 11, Jena 07745, Germany
REFERENCE 5 (bases 1 to 88549)
AUTHORS Baumgart,C.
TITLE Direct Submission
JOURNAL Submitted (21-FEB-2004) Genome Analysis, Institute of Molecular Biotechnology, Beutenberstr. 11, Jena 07745, Germany
COMMENT On Feb 21, 2004 this sequence version replaced gi:28829074.
CDS predictions from GeneID do not necessarily reflect true genes.
Further Information is available from IMB Jena, Department of Genome Analysis

COMMENT     this contig is an assembly of BAC 23B10 from 1 to: 41462, strain
            OR74A, cosmid 1K2 from 41463 to: 69790, cosmid library at DKFZ,
            strain OR74A and cosmid 39C11 from 69791 to 99967, cosmid library
            pLORIST6Xh, strain 74-OR-23-1A; BAC clone 23B10 and cosmid clone
            39C11 is available at the Fungal Genetic Stock Center,
            http://www.fgsc.net cosmid clone 1k2 is available from J. Hoheisel
            at DKFZ, e-mail:
            J.Hoheisel@dkfz-heidelberg.de
            Sequencing was performed by MWG Biotech AG, Ebersberg, Germany,
            http://www.mwgdna.com
            Information on performance of analysis and a more detailed
            annotation of this entry and other sequences of linkage groups II
            and V can be viewed at: http://mips.gsf.de/proj/neurospora.

            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On May 17, 2002 this sequence version replaced gi:17940809.
            -------------- Genome Center
                Center: Baylor College of Medicine
                Center code: BCM
                Web site: http://www.hgsc.bcm.tmc.edu/
                Contact: hgsc-help@bcm.tmc.edu
            -------------- Project Information
                Center project name: DROB
                Center clone name: RP98-23J3
            -------------- Summary Statistics
                Sequencing vector: Plasmid;
                Sequencing vector: M13;
                Chemistry: Dye-terminator Big Dye: 99% of reads
                Assembly program: Phrap; version 0.990329
                Consensus quality: 177843 bases at least Q40
                Consensus quality: 178008 bases at least Q30
                Consensus quality: 178254 bases at least Q20
                Estimated insert size: 175210; sum-of-contigs estimation
                Quality coverage: 5x in Q20 bases; sum-of-contigs estimation
            --------------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 2 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1    73824: contig of 73824 bp in length
            *    73825    73924: gap of unknown length
            *    73925   179069: contig of 105145 bp in length.

TITLE Direct Submission
JOURNAL Submitted (22-MAR-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
COMMENT On Mar 22, 2003 this sequence version replaced gi:22902011.
INFORMATION: http://www.hgsc.bcm.tmc.edu/ or email gc-help@bcm.tmc.edu

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

ANNOTATION OF FEATURES:
STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.
Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.
Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL:
http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html.

  TITLE     Direct Submission
  JOURNAL   Submitted (10-MAY-2003) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On May 10, 2003 this sequence version replaced gi:23617376.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

REFERENCE 3 (bases 1 to 254668)
AUTHORS Rat Genome Sequencing Consortium.
TITLE Direct Submission
JOURNAL Submitted (19-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
COMMENT On Nov 19, 2002 this sequence version replaced gi:23683155.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.
-------------- Genome Center
Center: Baylor College of Medicine
Center code: BCM
Web site: http://www.hgsc.bcm.tmc.edu/
Contact: hgsc-help@bcm.tmc.edu
-------------- Project Information
Center project name: GRZW
Center clone name: CH230-96C8
-------------- Summary Statistics
Assembly program: Phrap; version 0.990329
Consensus quality: 237238 bases at least Q40
Consensus quality: 241030 bases at least Q30
Consensus quality: 243348 bases at least Q20
Estimated insert size: 246228; sum-of-contigs estimation
Quality coverage: 6x in Q20 bases; sum-of-contigs estimation
----
* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 2 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
* 1 136730: contig of 136730 bp in length
* 136731 136830: gap of unknown length
* 136831 254668: contig of 117838 bp in length.

COMMENT     On Sep 30, 2002 this sequence version replaced gi:22416327.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep XX-119C3 is from
            a Incyte Zebrafish AB BAC library VECTOR: pBeloBAC11
            Clone-derived Zebrafish pUC subclones occasionally display
            inconsistency over the length of mononucleotide A/T runs and
```

```
            conserved TA repeats. Where this is found the longest good quality
            representation will be submitted.
            -------------- Genome Center
            Center: Wellcome Trust Sanger Institute
            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: zfish-help@sanger.ac.uk
            --------------
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one subclone; and the assembly was confirmed by restriction digest,
            except on the rare occasion of the clone being a YAC.
            Any regions longer than 1kb tagged as misc-feature 'unsure' are
            part of a tandem repeat of more than 10kb in length where it has
            not been possible to anchor the base differences between repeat
            copies.  The region has been built up based on the repeat element
            to match the total size of repeat indicated by restriction digest,
            but repeat copies may not be in the correct order and the usual
            finishing criteria may not apply.

  TITLE     Direct Submission
  JOURNAL   Submitted (24-AUG-2002) Whitehead Institute/MIT Center for Genome
            Research, 320 Charles Street, Cambridge, MA 02141, USA
COMMENT     On Jul 13, 2000 this sequence version replaced gi:6730844.
            All repeats were identified using RepeatMasker:
            Smit, A.F.A. & Green, P. (1996-1997)
            http://ftp.genome.washington.edu/RM/RepeatMasker.html
            -------------- Genome Center
                Center: Whitehead Institute/ MIT Center for Genome Research
                Center code: WIBR
                Web site: http://www-seq.wi.mit.edu
                Contact: sequence_submissions@genome.wi.mit.edu
            -------------- Project Information
                Center project name: L4942
                Center clone name: 128_A_23
            --------------.
            * NOTE: This record contains 85 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      867: contig of 867 bp in length
            *      868      967: gap of 100 bp
            *      968     1849: contig of 882 bp in length
            *     1850     1949: gap of 100 bp

            -------------- Genome Center
            Center: Wellcome Trust Sanger Institute
            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: zfish-help@sanger.ac.uk
            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
```

chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.
The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep Clone-derived Zebrafish pUC subclones occasionally display inconsistency over the length of mononucleotide A/T runs and conserved TA repeats. Where this is found the longest good quality representation will be submitted.
Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'drr' were identified by Rick Waterman (Stephen Johnson lab, WashU). For further information see http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml DKEYP-34E1 is from a Zebrafish BAC library
VECTOR: pIndigoBAC-5.

TITLE Direct Submission
JOURNAL Submitted (21-SEP-2004) Balzergue S., UMRGV, INRA/CNRS, 2 rue Gaston Cremieux, 91057 Evry cedex, FRANCE
COMMENT PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at http://dbsgap.versailles.inra.fr/publiclines/. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (http://www.genoplante.com and http://genoplante-info.infobiogen.fr).

            Primer A: No sequence submitted
            Primer B: No sequence submitted
            STS size: 458
            Protocol:
            WGS-discovery (WGS):
            Paired-end low-coverage whole genome shotgun reads were generated
            from 9 breeds
            (German Shepherd, Rottweiler, Bedlington Terrier, Beagle, Labrador
            Retriever, English
            Shepherd, Italian Greyhound, Alaskan Malamute and the Portuguese
            Water Dog -100,000 each)
            and five other canids (Chinese, Alaskan, Indian and Spanish Gray
            Wolf as well as the
            Californian Coyote).
            The WGS reads were placed uniquely on the CanFam1.0 boxer assembly
            and SNP detection was
            carried out by SSAHA-SNP. 863872 reads were annotated as STSs and
            485941 SNPs were
            annotated with alleles from the boxer and the breed or canid from
            which the particular
            read came. The validation rate for these SNPs was estimated at
            approximately 98%.
            WGA-discovery (WGA) of Boxer/Poodle SNPs:
            A second set of SNPs was generated using a similar methodology
            except that the contigs
            from the 1.5x poodle assembly (Kirkness 2003) were used instead of
            WGS reads. Since this
            sequence lacked base quality scores, arbitrary quality scores of
            phred 40 were assigned
            before the poddle seqeunce was placed uniquely on the CanFam1.0
            boxer assembly and SNP
            detection was carried out by SSAHA-SNP. 1637780 SNPs were annotated
            with alleles from the
            boxer and the poodle. The validation rate for these SNPs was
            estimated at approximately TBD%.
            Internal-WGA-discovery (I-WGA):
            A third set of SNPs were discovered by comparing reads in the WGA
            assembly. SNPs were
            defined as mismatch positions that had a base quality of >= 30 on
            both reads in a region
            that aligned without gaps, and with at most one additional mismatch
            in the ten flanking
            bases. For each allele, at least one additional read had to confirm
            it. 731476 SNPs were
            annotated with alleles between the two boxer alleles. The
            validation rate for these SNPs
            was estimated at approximately TBD%.

            STS size: 467
            Protocol:
            WGS-discovery: Paired-end low-coverage whole genome shotgun reads
            were generated from 129S1/SvImJ, C3H/HeJ, and BALB/cByJ. The WGS
            reads were placed uniquely on the MGSCv3 C57BL/6J assembly and SNP
            detection was carried out by SSAHA-SNP. 225,000 reads were
            annotated
            as STSs and 81,000 SNPs were annotated with alleles from C57BL/6J
            and the strain from which the particular read came. The validation
            rate for these SNPs was estimated at approximately 98%.

            Primer A: No sequence submitted
            Primer B: No sequence submitted
            STS size: 477
            Protocol:
            WGS-discovery (WGS):
            Paired-end low-coverage whole genome shotgun reads were generated
            from 9 breeds
            (German Shepherd, Rottweiler, Bedlington Terrier, Beagle, Labrador
            Retriever, English
            Shepherd, Italian Greyhound, Alaskan Malamute and the Portuguese
            Water Dog -100,000 each)
            and five other canids (Chinese, Alaskan, Indian and Spanish Gray
            Wolf as well as the
            Californian Coyote).
            The WGS reads were placed uniquely on the CanFam1.0 boxer assembly
            and SNP detection was
            carried out by SSAHA-SNP. 863872 reads were annotated as STSs and
            485941 SNPs were
            annotated with alleles from the boxer and the breed or canid from
            which the particular
            read came. The validation rate for these SNPs was estimated at
            approximately 98%.
            WGA-discovery (WGA) of Boxer/Poodle SNPs:
            A second set of SNPs was generated using a similar methodology
            except that the contigs
            from the 1.5x poodle assembly (Kirkness 2003) were used instead of
            WGS reads. Since this
            sequence lacked base quality scores, arbitrary quality scores of
            phred 40 were assigned
            before the poddle seqeunce was placed uniquely on the CanFam1.0
            boxer assembly and SNP
            detection was carried out by SSAHA-SNP. 1637780 SNPs were annotated
            with alleles from the
            boxer and the poodle. The validation rate for these SNPs was
            estimated at approximately TBD%.
            Internal-WGA-discovery (I-WGA):
            A third set of SNPs were discovered by comparing reads in the WGA
            assembly. SNPs were
            defined as mismatch positions that had a base quality of >= 30 on
            both reads in a region
            that aligned without gaps, and with at most one additional mismatch
            in the ten flanking
            bases. For each allele, at least one additional read had to confirm
            it. 731476 SNPs were
            annotated with alleles between the two boxer alleles. The
            validation rate for these SNPs
            was estimated at approximately TBD%.

            Primer A: No sequence submitted
            Primer B: No sequence submitted
            STS size: 569
            Protocol:
            WGS-discovery (WGS):
            Paired-end low-coverage whole genome shotgun reads were generated
            from 9 breeds
            (German Shepherd, Rottweiler, Bedlington Terrier, Beagle, Labrador
            Retriever, English
            Shepherd, Italian Greyhound, Alaskan Malamute and the Portuguese
            Water Dog -100,000 each)
            and five other canids (Chinese, Alaskan, Indian and Spanish Gray
            Wolf as well as the
            Californian Coyote).
            The WGS reads were placed uniquely on the CanFam1.0 boxer assembly
            and SNP detection was
            carried out by SSAHA-SNP. 863872 reads were annotated as STSs and
            485941 SNPs were
            annotated with alleles from the boxer and the breed or canid from
            which the particular
            read came. The validation rate for these SNPs was estimated at
            approximately 98%.
            WGA-discovery (WGA) of Boxer/Poodle SNPs:
            A second set of SNPs was generated using a similar methodology
            except that the contigs
            from the 1.5x poodle assembly (Kirkness 2003) were used instead of
            WGS reads. Since this
            sequence lacked base quality scores, arbitrary quality scores of
            phred 40 were assigned
            before the poddle seqeunce was placed uniquely on the CanFam1.0
            boxer assembly and SNP
            detection was carried out by SSAHA-SNP. 1637780 SNPs were annotated
            with alleles from the
            boxer and the poodle. The validation rate for these SNPs was
            estimated at approximately TBD%.
            Internal-WGA-discovery (I-WGA):
            A third set of SNPs were discovered by comparing reads in the WGA
            assembly. SNPs were
            defined as mismatch positions that had a base quality of >= 30 on
            both reads in a region
            that aligned without gaps, and with at most one additional mismatch
            in the ten flanking
            bases. For each allele, at least one additional read had to confirm
            it. 731476 SNPs were
            annotated with alleles between the two boxer alleles. The
            validation rate for these SNPs
            was estimated at approximately TBD%.

            Primer A: No sequence submitted
            Primer B: No sequence submitted
            STS size: 591
            Protocol:
            WGS-discovery (WGS):
            Paired-end low-coverage whole genome shotgun reads were generated
            from 9 breeds
            (German Shepherd, Rottweiler, Bedlington Terrier, Beagle, Labrador
            Retriever, English
            Shepherd, Italian Greyhound, Alaskan Malamute and the Portuguese
            Water Dog -100,000 each)
            and five other canids (Chinese, Alaskan, Indian and Spanish Gray
            Wolf as well as the
            Californian Coyote).
            The WGS reads were placed uniquely on the CanFam1.0 boxer assembly
            and SNP detection was
            carried out by SSAHA-SNP. 863872 reads were annotated as STSs and
            485941 SNPs were
            annotated with alleles from the boxer and the breed or canid from
            which the particular
            read came. The validation rate for these SNPs was estimated at
            approximately 98%.
            WGA-discovery (WGA) of Boxer/Poodle SNPs:
            A second set of SNPs was generated using a similar methodology
            except that the contigs
            from the 1.5x poodle assembly (Kirkness 2003) were used instead of
            WGS reads. Since this
            sequence lacked base quality scores, arbitrary quality scores of
            phred 40 were assigned
            before the poddle seqeunce was placed uniquely on the CanFam1.0
            boxer assembly and SNP
            detection was carried out by SSAHA-SNP. 1637780 SNPs were annotated
            with alleles from the
            boxer and the poodle. The validation rate for these SNPs was
            estimated at approximately TBD%.
            Internal-WGA-discovery (I-WGA):
            A third set of SNPs were discovered by comparing reads in the WGA
            assembly. SNPs were
            defined as mismatch positions that had a base quality of >= 30 on
            both reads in a region
            that aligned without gaps, and with at most one additional mismatch
            in the ten flanking
            bases. For each allele, at least one additional read had to confirm
            it. 731476 SNPs were
            annotated with alleles between the two boxer alleles. The
            validation rate for these SNPs
            was estimated at approximately TBD%.

            annotated with alleles from the boxer and the breed or canid from
            which the particular
            read came. The validation rate for these SNPs was estimated at
            approximately 98%.
            WGA-discovery (WGA) of Boxer/Poodle SNPs:
            A second set of SNPs was generated using a similar methodology
            except that the contigs
            from the 1.5x poodle assembly (Kirkness 2003) were used instead of
            WGS reads. Since this
            sequence lacked base quality scores, arbitrary quality scores of
            phred 40 were assigned
            before the poddle seqeunce was placed uniquely on the CanFam1.0
            boxer assembly and SNP
            detection was carried out by SSAHA-SNP. 1637780 SNPs were annotated
            with alleles from the
            boxer and the poodle. The validation rate for these SNPs was
            estimated at approximately TBD%.
            Internal-WGA-discovery (I-WGA):
            A third set of SNPs were discovered by comparing reads in the WGA
            assembly. SNPs were
            defined as mismatch positions that had a base quality of >= 30 on
            both reads in a region
            that aligned without gaps, and with at most one additional mismatch
            in the ten flanking
            bases. For each allele, at least one additional read had to confirm
            it. 731476 SNPs were
            annotated with alleles between the two boxer alleles. The
            validation rate for these SNPs
            was estimated at approximately TBD%.

            STS size: 619
            Protocol:
            WGS-discovery (WGS):
            Paired-end low-coverage whole genome shotgun reads were generated
            from 9 breeds
            (German Shepherd, Rottweiler, Bedlington Terrier, Beagle, Labrador
            Retriever, English
            Shepherd, Italian Greyhound, Alaskan Malamute and the Portuguese
            Water Dog -100,000 each)
            and five other canids (Chinese, Alaskan, Indian and Spanish Gray
            Wolf as well as the
            Californian Coyote).
            The WGS reads were placed uniquely on the CanFam1.0 boxer assembly
            and SNP detection was
            carried out by SSAHA-SNP. 863872 reads were annotated as STSs and
            485941 SNPs were
            annotated with alleles from the boxer and the breed or canid from
            which the particular
            read came. The validation rate for these SNPs was estimated at
            approximately 98%.
            WGA-discovery (WGA) of Boxer/Poodle SNPs:
            A second set of SNPs was generated using a similar methodology
            except that the contigs
            from the 1.5x poodle assembly (Kirkness 2003) were used instead of
            WGS reads. Since this

            Shepherd, Italian Greyhound, Alaskan Malamute and the Portuguese
            Water Dog -100,000 each)
            and five other canids (Chinese, Alaskan, Indian and Spanish Gray
            Wolf as well as the
            Californian Coyote).
            The WGS reads were placed uniquely on the CanFam1.0 boxer assembly
            and SNP detection was
            carried out by SSAHA-SNP. 863872 reads were annotated as STSs and
            485941 SNPs were
            annotated with alleles from the boxer and the breed or canid from
            which the particular
            read came. The validation rate for these SNPs was estimated at
            approximately 98%.
            WGA-discovery (WGA) of Boxer/Poodle SNPs:
            A second set of SNPs was generated using a similar methodology
            except that the contigs
            from the 1.5x poodle assembly (Kirkness 2003) were used instead of
            WGS reads. Since this
            sequence lacked base quality scores, arbitrary quality scores of
            phred 40 were assigned
            before the poddle seqeunce was placed uniquely on the CanFam1.0
            boxer assembly and SNP
            detection was carried out by SSAHA-SNP. 1637780 SNPs were annotated
            with alleles from the
            boxer and the poodle. The validation rate for these SNPs was
            estimated at approximately TBD%.
            Internal-WGA-discovery (I-WGA):
            A third set of SNPs were discovered by comparing reads in the WGA
            assembly. SNPs were
            defined as mismatch positions that had a base quality of >= 30 on
            both reads in a region
            that aligned without gaps, and with at most one additional mismatch
            in the ten flanking
            bases. For each allele, at least one additional read had to confirm
            it. 731476 SNPs were
            annotated with alleles between the two boxer alleles. The
            validation rate for these SNPs
            was estimated at approximately TBD%.

            Primer A: No sequence submitted
            Primer B: No sequence submitted
            STS size: 623
            Protocol:
            23,021,928 chimpanzee whole genome shotgun reads were aligned to
            the Human genome NCBI
            Build 34 (hg16,July 2003). Chimp WGS reads were from 9 donors,
            including Clint (Pan
            troglodytes verus), 3 other Pan troglodytes verus chimps
            (Donald,Karlien,Yvonne), 3 Pan
            troglodytes troglodytes chimps (Noemie,Masuku,Clara) and 2 chimps
            of unknown origin
            (Gon,Unknown Chimp). Common names:  Pan troglodytes verus is the
            western chimp and Pan
            troglodytes troglodytes is the central chimp. To be included in
            chimpanzee SNP discovery, a
            read must be at least 500bp in length, at least 50% of its base
            calls must have Phred
            score >= 20, at least 30% of its base calls must satisfy
            SNQS(30,25)(single strand NQS, the
            base in question has Phred score >= 30, the surrounding 10 bases in
            the read have Phred
            score >= 25), and the read must have at least 200 bp SNQS(30,25)
            bases. Reads not uniquely
            placed in the genome and read pairs whose two ends were not
            consistently placed were
            discarded. After above filtering, NQS(30,25) standard was applied
            to all pairs of
            overlapping reads to call NQS bases and SNPs. Alignments (between
            two reads) with less
            than 100 NQS bases or with SNP rate > 0.01 were discarded. To
            exclude alignment between two
            copies of a single read, comparisons between two reads that share
            95% of their genome
            alignments (>=95% bases of read A and >=95% bases of read B were
            placed at the same locus
            of human genome) were discarded.

            Protocol:
            WGS-discovery (WGS):
            Paired-end low-coverage whole genome shotgun reads were generated
            from 9 breeds
            (German Shepherd, Rottweiler, Bedlington Terrier, Beagle, Labrador
            Retriever, English
            Shepherd, Italian Greyhound, Alaskan Malamute and the Portuguese
            Water Dog -100,000 each)
            and five other canids (Chinese, Alaskan, Indian and Spanish Gray
            Wolf as well as the
            Californian Coyote).
```

```
            The WGS reads were placed uniquely on the CanFam1.0 boxer assembly
            and SNP detection was
            carried out by SSAHA-SNP. 863872 reads were annotated as STSs and
            485941 SNPs were
            annotated with alleles from the boxer and the breed or canid from
            which the particular
            read came. The validation rate for these SNPs was estimated at
            approximately 98%.
            WGA-discovery (WGA) of Boxer/Poodle SNPs:
            A second set of SNPs was generated using a similar methodology
            except that the contigs
            from the 1.5x poodle assembly (Kirkness 2003) were used instead of
            WGS reads. Since this
            sequence lacked base quality scores, arbitrary quality scores of
            phred 40 were assigned
            before the poddle seqeunce was placed uniquely on the CanFam1.0
            boxer assembly and SNP
            detection was carried out by SSAHA-SNP. 1637780 SNPs were annotated
            with alleles from the
            boxer and the poodle. The validation rate for these SNPs was
            estimated at approximately TBD%.
            Internal-WGA-discovery (I-WGA):
            A third set of SNPs were discovered by comparing reads in the WGA
            assembly. SNPs were
            defined as mismatch positions that had a base quality of >= 30 on
            both reads in a region
            that aligned without gaps, and with at most one additional mismatch
            in the ten flanking
            bases. For each allele, at least one additional read had to confirm
            it. 731476 SNPs were
            annotated with alleles between the two boxer alleles. The
            validation rate for these SNPs
            was estimated at approximately TBD%.

            STS size: 641
            Protocol:
            WGS-discovery: Paired-end low-coverage whole genome shotgun reads
            were generated from 129S1/SvImJ, C3H/HeJ, and BALB/cByJ. The WGS
            reads were placed uniquely on the MGSCv3 C57BL/6J assembly and SNP
            detection was carried out by SSAHA-SNP. 225,000 reads were
            annotated
            as STSs and 81,000 SNPs were annotated with alleles from C57BL/6J
            and the strain from which the particular read came. The validation
            rate for these SNPs was estimated at approximately 98%.

            Primer A: No sequence submitted
            Primer B: No sequence submitted
            STS size: 681
            Protocol:
            23,021,928 chimpanzee whole genome shotgun reads were aligned to
            the Human genome NCBI
            Build 34 (hg16,July 2003). Chimp WGS reads were from 9 donors,
            including Clint (Pan
            troglodytes verus), 3 other Pan troglodytes verus chimps
            (Donald,Karlien,Yvonne), 3 Pan
            troglodytes troglodytes chimps (Noemie,Masuku,Clara) and 2 chimps
            of unknown origin
            (Gon,Unknown Chimp). Common names:  Pan troglodytes verus is the
            western chimp and Pan
            troglodytes troglodytes is the central chimp. To be included in
            chimpanzee SNP discovery, a
            read must be at least 500bp in length, at least 50% of its base
            calls must have Phred
            score >= 20, at least 30% of its base calls must satisfy
            SNQS(30,25)(single strand NQS, the
            base in question has Phred score >= 30, the surrounding 10 bases in
            the read have Phred
            score >= 25), and the read must have at least 200 bp SNQS(30,25)
            bases. Reads not uniquely
            placed in the genome and read pairs whose two ends were not
            consistently placed were
            discarded. After above filtering, NQS(30,25) standard was applied
            to all pairs of
            overlapping reads to call NQS bases and SNPs. Alignments (between
            two reads) with less
            than 100 NQS bases or with SNP rate > 0.01 were discarded. To
            exclude alignment between two
            copies of a single read, comparisons between two reads that share
            95% of their genome
            alignments (>=95% bases of read A and >=95% bases of read B were
            placed at the same locus
            of human genome) were discarded.

            Email: mczody@broad.mit.edu
            Primer A: No sequence submitted
            Primer B: No sequence submitted
            STS size: 687
            Protocol:
            23,021,928 chimpanzee whole genome shotgun reads were aligned to
            the Human genome NCBI
            Build 34 (hg16,July 2003). Chimp WGS reads were from 9 donors,
            including Clint (Pan
            troglodytes verus), 3 other Pan troglodytes verus chimps
            (Donald,Karlien,Yvonne), 3 Pan
            troglodytes troglodytes chimps (Noemie,Masuku,Clara) and 2 chimps
            of unknown origin
            (Gon,Unknown Chimp). Common names:  Pan troglodytes verus is the
            western chimp and Pan
            troglodytes troglodytes is the central chimp. To be included in
            chimpanzee SNP discovery, a
            read must be at least 500bp in length, at least 50% of its base
            calls must have Phred
            score >= 20, at least 30% of its base calls must satisfy
            SNQS(30,25)(single strand NQS, the
            base in question has Phred score >= 30, the surrounding 10 bases in
            the read have Phred
            score >= 25), and the read must have at least 200 bp SNQS(30,25)
            bases. Reads not uniquely
            placed in the genome and read pairs whose two ends were not
            consistently placed were
            discarded. After above filtering, NQS(30,25) standard was applied
            to all pairs of
            overlapping reads to call NQS bases and SNPs. Alignments (between
            two reads) with less
            than 100 NQS bases or with SNP rate > 0.01 were discarded. To
            exclude alignment between two
            copies of a single read, comparisons between two reads that share
            95% of their genome
            alignments (>=95% bases of read A and >=95% bases of read B were
            placed at the same locus
            of human genome) were discarded.

            Email: mczody@broad.mit.edu
            Primer A: No sequence submitted
            Primer B: No sequence submitted
            STS size: 737
            Protocol:
            23,021,928 chimpanzee whole genome shotgun reads were aligned to
            the Human genome NCBI
            Build 34 (hg16,July 2003). Chimp WGS reads were from 9 donors,
            including Clint (Pan
            troglodytes verus), 3 other Pan troglodytes verus chimps
            (Donald,Karlien,Yvonne), 3 Pan
            troglodytes troglodytes chimps (Noemie,Masuku,Clara) and 2 chimps
            of unknown origin
            (Gon,Unknown Chimp). Common names:  Pan troglodytes verus is the
            western chimp and Pan
            troglodytes troglodytes is the central chimp. To be included in
            chimpanzee SNP discovery, a
            read must be at least 500bp in length, at least 50% of its base
            calls must have Phred
            score >= 20, at least 30% of its base calls must satisfy
            SNQS(30,25)(single strand NQS, the
            base in question has Phred score >= 30, the surrounding 10 bases in
            the read have Phred
            score >= 25), and the read must have at least 200 bp SNQS(30,25)
            bases. Reads not uniquely
            placed in the genome and read pairs whose two ends were not
            consistently placed were
            discarded. After above filtering, NQS(30,25) standard was applied
            to all pairs of
            overlapping reads to call NQS bases and SNPs. Alignments (between
            two reads) with less
            than 100 NQS bases or with SNP rate > 0.01 were discarded. To
            exclude alignment between two
            copies of a single read, comparisons between two reads that share
            95% of their genome
            alignments (>=95% bases of read A and >=95% bases of read B were
            placed at the same locus
            of human genome) were discarded.

            Primer A: No sequence submitted
            Primer B: No sequence submitted
            STS size: 795
            Protocol:
            23,021,928 chimpanzee whole genome shotgun reads were aligned to
            the Human genome NCBI
            Build 34 (hg16,July 2003). Chimp WGS reads were from 9 donors,
            including Clint (Pan
            troglodytes verus), 3 other Pan troglodytes verus chimps
            (Donald,Karlien,Yvonne), 3 Pan
            troglodytes troglodytes chimps (Noemie,Masuku,Clara) and 2 chimps
            of unknown origin
            (Gon,Unknown Chimp). Common names:  Pan troglodytes verus is the
            western chimp and Pan
            troglodytes troglodytes is the central chimp. To be included in
            chimpanzee SNP discovery, a
            read must be at least 500bp in length, at least 50% of its base
            calls must have Phred
            score >= 20, at least 30% of its base calls must satisfy
            SNQS(30,25)(single strand NQS, the
            base in question has Phred score >= 30, the surrounding 10 bases in
            the read have Phred
            score >= 25), and the read must have at least 200 bp SNQS(30,25)
            bases. Reads not uniquely
            placed in the genome and read pairs whose two ends were not
            consistently placed were
            discarded. After above filtering, NQS(30,25) standard was applied
            to all pairs of
            overlapping reads to call NQS bases and SNPs. Alignments (between
            two reads) with less
            than 100 NQS bases or with SNP rate > 0.01 were discarded. To
            exclude alignment between two
            copies of a single read, comparisons between two reads that share
            95% of their genome
            alignments (>=95% bases of read A and >=95% bases of read B were
            placed at the same locus
            of human genome) were discarded.

            Protocol:
            WGS-discovery: Paired-end low-coverage whole genome shotgun reads
            were generated from 129S1/SvImJ, C3H/HeJ, and BALB/cByJ. The WGS
            reads were placed uniquely on the MGSCv3 C57BL/6J assembly and SNP
            detection was carried out by SSAHA-SNP. 225,000 reads were
            annotated
            as STSs and 81,000 SNPs were annotated with alleles from C57BL/6J
            and the strain from which the particular read came. The validation
            rate for these SNPs was estimated at approximately 98%.

            Primer A: No sequence submitted
```

Primer B: No sequence submitted
STS size: 837
Protocol:
23,021,928 chimpanzee whole genome shotgun reads were aligned to the Human genome NCBI
Build 34 (hg16,July 2003). Chimp WGS reads were from 9 donors, including Clint (Pan
troglodytes verus), 3 other Pan troglodytes verus chimps (Donald,Karlien,Yvonne), 3 Pan
troglodytes troglodytes chimps (Noemie,Masuku,Clara) and 2 chimps of unknown origin
(Gon,Unknown Chimp). Common names: Pan troglodytes verus is the western chimp and Pan
troglodytes troglodytes is the central chimp. To be included in chimpanzee SNP discovery, a
read must be at least 500bp in length, at least 50% of its base calls must have Phred
score >= 20, at least 30% of its base calls must satisfy SNQS(30,25)(single strand NQS, the
base in question has Phred score >= 30, the surrounding 10 bases in the read have Phred
score >= 25), and the read must have at least 200 bp SNQS(30,25) bases. Reads not uniquely
placed in the genome and read pairs whose two ends were not consistently placed were
discarded. After above filtering, NQS(30,25) standard was applied to all pairs of
overlapping reads to call NQS bases and SNPs. Alignments (between two reads) with less
than 100 NQS bases or with SNP rate > 0.01 were discarded. To exclude alignment between two
copies of a single read, comparisons between two reads that share 95% of their genome
alignments (>=95% bases of read A and >=95% bases of read B were placed at the same locus
of human genome) were discarded.

            Primer A: No sequence submitted
```

```
            Primer B: No sequence submitted
            STS size: 866
            Protocol:
            23,021,928 chimpanzee whole genome shotgun reads were aligned to
            the Human genome NCBI
            Build 34 (hg16,July 2003). Chimp WGS reads were from 9 donors,
            including Clint (Pan
            troglodytes verus), 3 other Pan troglodytes verus chimps
            (Donald,Karlien,Yvonne), 3 Pan
            troglodytes troglodytes chimps (Noemie,Masuku,Clara) and 2 chimps
            of unknown origin
            (Gon,Unknown Chimp). Common names:  Pan troglodytes verus is the
            western chimp and Pan
            troglodytes troglodytes is the central chimp. To be included in
            chimpanzee SNP discovery, a
            read must be at least 500bp in length, at least 50% of its base
            calls must have Phred
            score >= 20, at least 30% of its base calls must satisfy
            SNQS(30,25)(single strand NQS, the
            base in question has Phred score >= 30, the surrounding 10 bases in
            the read have Phred
            score >= 25), and the read must have at least 200 bp SNQS(30,25)
            bases. Reads not uniquely
            placed in the genome and read pairs whose two ends were not
            consistently placed were
            discarded. After above filtering, NQS(30,25) standard was applied
            to all pairs of
            overlapping reads to call NQS bases and SNPs. Alignments (between
            two reads) with less
            than 100 NQS bases or with SNP rate > 0.01 were discarded. To
            exclude alignment between two
            copies of a single read, comparisons between two reads that share
            95% of their genome
            alignments (>=95% bases of read A and >=95% bases of read B were
            placed at the same locus
            of human genome) were discarded.

TITLE Direct Submission

JOURNAL Submitted (19-AUG-2002) Salk Institute Genomic Analysis Laboratory (SIGnAL), Plant Biology Laboratory, The Salk Institute for Biological Studies, 10010 N. Torrey Pines Road, La Jolla, CA 92037, USA

COMMENT RIKEN Genomic Sciences Center (GSC) members carried out the collection and clustering of RAFL cDNAs (RAFL cDNA : 'RIKEN Arabidopsis Full-Length cDNA') : Seki,M., Narusaka,M., Ishida,J., Satou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai,J., Hayashizaki,Y. and Shinozaki,K.

The Salk, Stanford, PGEC (SSP) Consortium members constructed and sequenced the pUNI (ORF) clones using the RAFL cDNAs: Cheuk,R., Chen,H., Kim,C.J., Shinn,P., Banh,J. Bowser,L., Chan,M.M., Chang,E., Dale,J.M., Deng, J.M., Goldsmith,A.D., Jones,T., Karlin-Neumann,G., Lam,B., Lee,J.M., Lin,J., Miranda,M., Nguyen,M., Onodera,C.S., Palm,C.J., Quach,H.L., Southwick,A., Tang,C.C., Toriumi,M., Wu,H.C., Yamada,K., Yamamura, Y., Yu,G., Davis,R.W., Theologis,A., and Ecker,J.R.

Cheuk,R. (SSP/Salk) and Seki,M. (RIKEN GSC) contributed equally to this work. Shinozaki,K. (RIKEN GSC) and Ecker,J.R. (SSP/Salk) contributed equally to this work as PIs.

COMMENT     This STS is part of a random genomic sequencing program of thirteen
            yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
            exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,
            Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces
            lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
            angusta, Debaryomyces hansenii var.  hansenii, Pichia sorbitophila,
            Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
            5 kb were prepared and both extremities were sequenced. See
            keywords for description of this sequence and for the sequence of
            the other extremity of this insert.

TITLE Direct Submission

JOURNAL Submitted (20-MAR-2002) Plant Gene Expression Center, 800 Buchanan Street, Albany, CA 94710, USA

COMMENT The RIKEN Genomic Sciences Center (GSC) members carried out the collection and clustering of RAFL cDNAs (RAFL cDNA : 'RIKEN Arabidopsis Full-Length cDNA'): Seki,M., Narusaka,M., Ishida,J., Satou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai, J., Hayashizaki,Y. and Shinozaki,K.

The Salk, Stanford, PGEC (SSP) Consortium members constructed and sequenced the pUNI (ORF) clones using the RAFL cDNAs: Yamada,K., Banh,J., Chan,M.M., Chang,C.H., Chang,E., Dale,J.M., Deng,J.M., Goldsmith,A.D., Lee,J.M., Onodera,C.S., Quach,H.L., Tang,C.C., Toriumi,M., Wu,H.C., Yamamura,Y., Yu,G., Bowser,L., Chen,H., Cheuk,R., Jones,T., Karlin-Neumann,G., Kim,C., Lam,B., Lin,J., Meyers,M.C., Miranda,M., Nguyen,M., Palm,C.J., Shinn,P., Southwick,A., Davis,R.W., Ecker,J.R. and Theologis,A.

Yamada,K. (SSP/PGEC) and Seki, M. (RIKEN GSC) contributed equally to this work. Shinozaki,K. (RIKEN GSC) and Theologis,A. (SSP

```
           /PGEC) contributed equally to this work as PIs.

           Annotation is based on the January 2002 version of the Arabidopsis
           genome submitted to GenBank.

COMMENT     RIKEN Genomic Sciences Center (GSC) members carried out the
            collection and clustering of RAFL cDNAs (RAFL cDNA : 'RIKEN
            Arabidopsis Full-Length cDNA'): Seki,M., Narusaka,M., Ishida,J.,
            Satou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai,J.,
            Hayashizaki,Y. and Shinozaki,K.

            The Salk, Stanford, PGEC (SSP) Consortium members carried out the
            sequencing and annotation of the RAFL cDNAs: Yamada,K., Chan,M.M.,
            Chang,C.H., Dale,J.M., Hsuan,V.W., Lee,J.M., Onodera,C.S.,
            Quach,H.L., Tang,C.C., Toriumi,M., Wong,C., Wu,H.C., Yu,G.,
            Yuan,S., Chen,H., Cheuk,R., Jones,T., Kim,C.J., Nguyen,M.,
            Palm,C.J., Shinn,P., Southwick,A., Tripp,M.G., Wu,T., Davis,R.W.,
            Ecker,J.R. and Theologis,A.

            Yamada,K. (SSP/PGEC) and Seki,M. (RIKEN GSC) contributed equally to
            this work. Shinozaki,K. (RIKEN GSC) and Theologis,A. (SSP/PGEC)
            contributed equally to this work as PIs.

            Annotation based on July 2002 version of the Arabidopsis genome
            submitted to Genbank.

  TITLE     Direct Submission
  JOURNAL   Submitted (14-FEB-2003) Plant Gene Expression Center, 800 Buchanan
            Street, Albany, CA 94710, USA
COMMENT     RIKEN Genomic Sciences Center (GSC) members carried out the
            collection and clustering of RAFL cDNAs (RAFL cDNA : 'RIKEN
            Arabidopsis Full-Length cDNA'): Seki,M., Narusaka,M., Ishida,J.,
            Satou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai,J.,
            Hayashizaki,Y. and Shinozaki,K.

            The Salk, Stanford, PGEC (SSP) Consortium members carried out the
            sequencing and annotation of the RAFL cDNAs: Yamada,K., Chan,M.M.,
            Chang,C.H., Dale,J.M., Hsuan,V.W., Lee,J.M., Onodera,C.S.,
            Quach,H.L., Tang,C.C., Toriumi,M., Wong,C., Wu,H.C., Yu,G.,
            Yuan,S., Chen,H., Cheuk,R., Jones,T., Kim,C.J., Nguyen,M.,
            Palm,C.J., Shinn,P., Southwick,A., Tripp,M.G., Wu,T., Davis,R.W.,
            Ecker,J.R. and Theologis,A.

            Yamada,K. (SSP/PGEC) and Seki,M. (RIKEN GSC) contributed equally to
            this work. Shinozaki,K. (RIKEN GSC) and Theologis,A. (SSP/PGEC)
            contributed equally to this work as PIs.

            Annotation based on July 2002 version of the Arabidopsis genome
            submitted to Genbank.

  TITLE     Direct Submission
  JOURNAL   Submitted (16-MAY-2003) Plant Gene Expression Center, 800 Buchanan
            Street, Albany, CA 94710, USA
COMMENT     RIKEN Genomic Sciences Center (GSC) members carried out the
            collection and clustering of RAFL cDNAs (RAFL cDNA : 'RIKEN
            Arabidopsis Full-Length cDNA'): Seki,M., Narusaka,M., Ishida,J.,
            Satou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai,J.,
            Hayashizaki,Y. and Shinozaki,K.

            The Salk, Stanford, PGEC (SSP) Consortium members carried out the
            sequencing and annotation of the RAFL cDNAs: Yamada,K., Dale,J.M.,
            Hsuan,V.W.,   Onodera,C.S., Quach,H.L., Toriumi,M., Wong,C.,
            Wu,H.C., Yu,G., Yuan,S.,  Chen,H., Cheuk,R., Jones,T., Kim,C.J.,
            Nguyen,M., Palm,C.J., Shinn,P.,  Southwick,A., Tripp,M.G., Wu,T.,
            Davis,R.W., Ecker,J.R. and Theologis,A.

            Yamada,K. (SSP/PGEC) and Seki,M. (RIKEN GSC) contributed equally to
            this  work.  Shinozaki,K. (RIKEN GSC) and Theologis,A. (SSP/PGEC)
            contributed  equally to this work as PIs.

            Annotation based on July 2002 version of the Arabidopsis genome
            submitted to Genbank.

  TITLE     Direct Submission
  JOURNAL   Submitted (03-JUL-2002) Berkeley Drosophila Genome Project,
            Lawrence Berkeley National Laboratory, One Cyclotron Road,
            Berkeley, CA 94720, USA
COMMENT     Sequence submitted by:
            Berkeley Drosophila Genome Project
            Lawrence Berkeley National Laboratory
            Berkeley, CA 94720
            This clone was sequenced as part of a high-throughput process to
            sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
            Science 2000). The sequence has been subjected to integrity checks
            for sequence accuracy, presence of a polyA tail and contiguity
            within 100 kb in the genome. Thus we believe the sequence to
            reflect accurately this particular cDNA clone. However, there are
            artifacts associated with the generation of cDNA clones that may
            have not been detected in our initial analyses such as internal
            priming, priming from contaminating genomic DNA, retained introns
            due to reverse transcription of unspliced precursor RNAs, and
            reverse transcriptase errors that result in single base changes.
            For further information about this sequence, including its location
            and relationship to other sequences, please visit our Web site
            (http://fruitfly.berkeley.edu) or send email to
            cdna@fruitfly.berkeley.edu.

            R. M.

            Clone distribution: MGC clone distribution information can be found
            through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov
            Series: IRAK Plate: 182 Row: h Column: 17
            This clone was selected for full length sequencing because it
            passed the following selection criteria: Similarity but not
            identity to protein.

  TITLE     Direct Submission
  JOURNAL   Submitted (15-NOV-2002) Berkeley Drosophila Genome Project,
            Lawrence Berkeley National Laboratory, One Cyclotron Road,
            Berkeley, CA 94720, USA
COMMENT     Sequence submitted by:
            Berkeley Drosophila Genome Project
             Lawrence Berkeley National Laboratory
            Berkeley, CA 94720
             This clone was sequenced as part of a high-throughput process to
            sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
            Science 2000). The sequence has been subjected to integrity checks
            for sequence accuracy, presence of a polyA tail and contiguity
            within 100 kb in the genome. Thus we believe the sequence to
            reflect accurately this particular cDNA clone. However, there are
            artifacts associated with the generation of cDNA clones that may
            have not been detected in our initial analyses such as internal
            priming, priming from contaminating genomic DNA, retained introns
            due to reverse transcription of unspliced precursor RNAs, and
            reverse transcriptase errors that result in single base changes.
            For further information about this sequence, including its location
            and relationship to other sequences, please visit our Web site
            (http://fruitfly.berkeley.edu) or send email to
            cdna@fruitfly.berkeley.edu.

  TITLE     Direct Submission
  JOURNAL   Submitted (25-MAY-2005) Berkeley Drosophila Genome Project,
            Lawrence Berkeley National Laboratory, One Cyclotron Road,
            Berkeley, CA 94720, USA
COMMENT     Sequence submitted by:
            Berkeley Drosophila Genome Project
            Lawrence Berkeley National Laboratory
            Berkeley, CA 94720
            This clone was sequenced as part of a high-throughput process to
            sequence clones from the Drosophila Gene Collection The sequence
            has been subjected to integrity checks for sequence accuracy,
            presence of a polyA tail and contiguity within 100 kb in the
            genome. Thus we believe the sequence to reflect accurately this
            particular cDNA clone. However, there are artifacts associated with
            the generation of cDNA clones that may have not been detected in
            our initial analyses such as internal priming, priming from
            contaminating genomic DNA, retained introns due to reverse
            transcription of unspliced precursor RNAs, and reverse
            transcriptase errors that result in single base changes. For
            further information about this sequence, including its location and
            relationship to other sequences, please visit our Web site
            (http://www.fruitfly.org) or send email to cdna@fruitfly.org.

  TITLE     Direct Submission
  JOURNAL   Submitted (10-AUG-2001) Berkeley Drosophila Genome Project,
            Lawrence Berkeley National Laboratory, One Cyclotron Road,
            Berkeley, CA 94720, USA
COMMENT     Sequence submitted by:
            Berkeley Drosophila Genome Project
            Lawrence Berkeley National Laboratory
            Berkeley, CA 94720
            This clone was sequenced as part of a high-throughput process to
            sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
            Science 2000). The sequence has been subjected to integrity checks
            for sequence accuracy, presence of a polyA tail and contiguity
            within 100 kb in the genome. Thus we believe the sequence to
            reflect accurately this particular cDNA clone.  However, there are
            artifacts associated with the generation of cDNA clones that may
            have not been detected in our initial analyses such as internal
            priming, priming from contaminating genomic DNA, retained introns
            due to reverse transcription of unspliced precursor RNAs, and
            reverse transcriptase errors that result in single base changes.
            For further information about this sequence, including its location
            and relationship to other sequences, please visit our Web site
            (http://fruitfly.berkeley.edu) or send email to
            cdna@fruitfly.berkeley.edu.

  COMMENT   NEDO human cDNA sequencing project supported by Ministry of
            Economy, Trade and Industry of Japan; cDNA full insert sequencing:
            Research Association for Biotechnology (RAB); cDNA library
            construction: Helix Research Institute (HRI) (supported by Japan
            Key Technology Center etc.); 5'- & 3'-end one pass sequencing: RAB,
            HRI, and Biotechnology Center, National Institute of Technology and
            Evaluation; clone selection for full insert sequencing: HRI and
            RAB; annotation: Reverse Proteomics Research Institute, HRI and
            RAB.

COMMENT     Sanger Xenopus tropicalis EST/cDNA project.
            This sequence is from a Xenopus Gene Collection (XGC) library, from
            a library constructed by Aaron M. Zorn. cDNA was prepared from RNA
            extracted from eggs. EcoRI-NotI cut cDNA was then ligated into
            pCS107 with EcoRI at the 5' end and NotI at the 3' end.
            Vector: pCS107; Site_1: EcoRI; Site_2: NotI
            Host: Escherichia coli XL1-blue.

  TITLE     Correction: nucleotide sequence of Ac
  JOURNAL   Cell 39 (2 Pt 1), 417 (1984)
   PUBMED   6094018
COMMENT     Original source text: Maize DNA, clone Ac wx-m9.
            [2]  revises [1].
            The ends of the Ac9 element comprise an 11 bp imperfect terminal
            repetition and the insertion site within the wx locus is flanked by
            an 8 bp directly repeated sequence.

  TITLE     Direct Submission
  JOURNAL   Submitted (12-AUG-2003) Berkeley Drosophila Genome Project,
            Lawrence Berkeley National Laboratory, One Cyclotron Road,
            Berkeley, CA 94720, USA
COMMENT     Sequence submitted by:
            Berkeley Drosophila Genome Project
             Lawrence Berkeley National Laboratory
            Berkeley, CA 94720
             This clone was sequenced as part of a high-throughput process to
            sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
            Science 2000). The sequence has been subjected to integrity checks
            for sequence accuracy, presence of a polyA tail and contiguity
            within 100 kb in the genome. Thus we believe the sequence to
            reflect accurately this particular cDNA clone. However, there are
            artifacts associated with the generation of cDNA clones that may
            have not been detected in our initial analyses such as internal
            priming, priming from contaminating genomic DNA, retained introns
            due to reverse transcription of unspliced precursor RNAs, and
            reverse transcriptase errors that result in single base changes.
            For further information about this sequence, including its location
            and relationship to other sequences, please visit our Web site
            (http://fruitfly.berkeley.edu) or send email to
            cdna@fruitfly.berkeley.edu.

  TITLE     Direct Submission
  JOURNAL   Submitted (14-JUN-2002) Berkeley Drosophila Genome Project,
            Lawrence Berkeley National Laboratory, One Cyclotron Road,
            Berkeley, CA 94720, USA
COMMENT     Sequence submitted by:
            Berkeley Drosophila Genome Project
             Lawrence Berkeley National Laboratory
            Berkeley, CA 94720
             This clone was sequenced as part of a high-throughput process to
            sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
            Science 2000). The sequence has been subjected to integrity checks
            for sequence accuracy, presence of a polyA tail and contiguity
            within 100 kb in the genome. Thus we believe the sequence to
            reflect accurately this particular cDNA clone. However, there are
            artifacts associated with the generation of cDNA clones that may
            have not been detected in our initial analyses such as internal
            priming, priming from contaminating genomic DNA, retained introns
            due to reverse transcription of unspliced precursor RNAs, and
            reverse transcriptase errors that result in single base changes.
            For further information about this sequence, including its location
            and relationship to other sequences, please visit our Web site
            (http://fruitfly.berkeley.edu) or send email to
            cdna@fruitfly.berkeley.edu.

RESULT 370
AF411929
LOCUS AF411929 9049 bp DNA linear INV 04-AUG-2003
DEFINITION Plasmodium falciparum strain FVO normocyte-binding protein 1 (NBP1) gene, complete cds.
ACCESSION AF411929
VERSION AF411929.2 GI:33414600
KEYWORDS .
SOURCE Plasmodium falciparum (malaria parasite P. falciparum)
ORGANISM Plasmodium falciparum
Eukaryota; Alveolata; Apicomplexa; Haemosporida; Plasmodium.
REFERENCE 1 (bases 1 to 9049)
AUTHORS Rayner,J.C., Vargas-Serrato,E., Huber,C.S., Galinski,M.R. and Barnwell,J.W.
TITLE A Plasmodium falciparum Homologue of Plasmodium vivax Reticulocyte Binding Protein (PvRBP1) Defines a Trypsin-resistant Erythrocyte Invasion Pathway
JOURNAL J. Exp. Med. 194 (11), 1571-1582 (2001)
PUBMED 11733572
REFERENCE 2 (bases 1 to 9049)
AUTHORS Rayner,J.C., Barnwell,J.W., Galinski,M.R., Tran,T., Huber,C.S. and Corredor,V.
TITLE Differing geographic diversity among members of the Reticulocyte Binding Like (RBL) gene family of the two major human malaria parasites, Plasmodium falciparum and Plasmodium vivax
JOURNAL Unpublished
REFERENCE 3 (bases 1 to 9049)
AUTHORS Rayner,J.C., Barnwell,J.W. and Galinski,M.R.
TITLE Direct Submission
JOURNAL Submitted (22-AUG-2001) Division of Parasitic Diseases, Centers for Disease Control and Prevention, 4770 Buford Highway, MS F-13, Chamblee, GA 30341, USA
REFERENCE 4 (bases 1 to 9049)
AUTHORS Rayner,J.C., Barnwell,J.W. and Galinski,M.R.
TITLE Direct Submission
JOURNAL Submitted (29-AUG-2002) Division of Parasitic Diseases, Centers for Disease Control and Prevention, 4770 Buford Highway, MS F-13, Chamblee, GA 30341, USA
REMARK Sequence update by submitter
COMMENT On Aug 4, 2003 this sequence version replaced gi:17352155.

Contact: vega@sanger.ac.uk

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.
Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to confirm this sequence. Sequence data from the whole genome shotgun alone has only been used where it has a phred quality of at least 30.
RP23-296N19 is from the RPCI-23 Mouse BAC Library constructed by the group of Pieter de Jong.
For further details see http://www.chori.org/bacpac/home.htm
VECTOR: pBACe3.6.

NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one m13 subclone.

For a graphical representation of this clone sequence and its analysis see:
http://www.wormbase.org/db/seq/sequence?name=ZK75;class=Sequence

NEIGHBORING CLONE INFORMATION

The 5' clone is B0034, 200 bp overlap; the 3' clone is ZK84, 400 bp overlap. Actual start of this clone is at base position 1 of ZK75; actual end is at 22444 of ZK84.

NOTES:

Coding seqences below are the result of integration and manual review of the following data : computer analysis using the program Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C. elegans ORFeome cloning project (http://worfdb.dfci.harvard.edu/), similarity to other proteins from BlastX analyses (http://blast.wustl.edu/), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research 10:1115-1125, 2000), individual C. elegans GenBank submissions, and personal communications with C. elegans researchers. tRNAs are predicted using the program tRNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

COMMENT     Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University
                  St. Louis , MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 IRQ, England
                  email: submissions@watson.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted: all
            regions were double stranded, sequenced with an alternate chemistry
            or covered by high quality data (i.e., phred quality >= 30); an
            attempt was made to resolve all sequencing problems, such as
            compressions and repeats; all regions were covered by sequence from
            more than one m13 subclone.

            For a graphical representation of this clone sequence and its
            analysis see:
            http://www.wormbase.org/db/seq/sequence?name=ZK75;class=Sequence

                        NEIGHBORING CLONE INFORMATION
```

The 5' clone is B0034, 200 bp overlap; the 3' clone is ZK84, 400 bp overlap. Actual start of this clone is at base position 1 of ZK75; actual end is at 22444 of ZK84.

NOTES:

Coding seqences below are the result of integration and manual review of the following data : computer analysis using the program Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C. elegans ORFeome cloning project (http://worfdb.dfci.harvard.edu/), similarity to other proteins from BlastX analyses (http://blast.wustl.edu/), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research 10:1115-1125, 2000), individual C. elegans GenBank submissions, and personal communications with C. elegans researchers. tRNAs are predicted using the program tRNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

LOCUS       BOVCASAS2X              21246 bp    DNA     linear   MAM 26-APR-1993
DEFINITION  Bovine alpha s2 casein type A protein (CASAS2) gene, exons 1-18.
ACCESSION   M94327
VERSION     M94327.1  GI:162795
KEYWORDS    alpha s2 casein protein type A.
SOURCE      Bos taurus (cow)
  ORGANISM  Bos taurus
            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
            Mammalia; Eutheria; Laurasiatheria; Cetartiodactyla; Ruminantia;
            Pecora; Bovidae; Bovinae; Bos.

COMMENT     Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University
                  St. Louis , MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 IRQ, England
                  email: submissions@watson.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted: all
            regions were double stranded, sequenced with an alternate chemistry
            or covered by high quality data (i.e., phred quality >= 30); an
            attempt was made to resolve all sequencing problems, such as
            compressions and repeats; all regions were covered by sequence from
            more than one m13 subclone.

            For a graphical representation of this clone sequence and its
            analysis see:
            http://www.wormbase.org/db/seq/sequence?name=H12I13;class=Sequence

                        NEIGHBORING CLONE INFORMATION

            The 5' clone is R12C12, 1980 bp overlap; the 3' clone is F21H12,
            200 bp overlap. Actual start of this clone is at base position
            28566 of R12C12; actual end is at 10191 of F21H12.

            NOTES:

            Coding seqences below are the result of integration and manual
            review of the following data : computer analysis using the program
            Genefinder (P. Green and L. Hillier, personal communication), the
            large scale EST projects of Yuji Kohara
            (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C.
            elegans ORFeome cloning project (http://worfdb.dfci.harvard.edu/),
            similarity to other proteins from BlastX analyses
            (http://blast.wustl.edu/), sequence conservation with C. briggsae
            using Jim Kent's WABA alignment program (Genome Research
            10:1115-1125, 2000), individual C. elegans GenBank submissions,
            and personal communications with C. elegans researchers. tRNAs
            are predicted using the program tRNAscan-SE (Lowe, T.M. and
            Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

COMMENT     Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University
                  St. Louis , MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 IRQ, England
                  email: submissions@watson.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted: all
            regions were double stranded, sequenced with an alternate chemistry
            or covered by high quality data (i.e., phred quality >= 30); an
            attempt was made to resolve all sequencing problems, such as
            compressions and repeats; all regions were covered by sequence from
            more than one m13 subclone.

            For a graphical representation of this clone sequence and its
            analysis see:
            http://www.wormbase.org/db/seq/sequence?name=H12I13;class=Sequence

                        NEIGHBORING CLONE INFORMATION

            The 5' clone is R12C12, 1980 bp overlap; the 3' clone is F21H12,
            200 bp overlap. Actual start of this clone is at base position
            28566 of R12C12; actual end is at 10191 of F21H12.

            NOTES:

            Coding seqences below are the result of integration and manual
            review of the following data : computer analysis using the program
            Genefinder (P. Green and L. Hillier, personal communication), the
            large scale EST projects of Yuji Kohara
            (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C.
            elegans ORFeome cloning project (http://worfdb.dfci.harvard.edu/),
            similarity to other proteins from BlastX analyses
            (http://blast.wustl.edu/), sequence conservation with C. briggsae
            using Jim Kent's WABA alignment program (Genome Research
            10:1115-1125, 2000), individual C. elegans GenBank submissions,
            and personal communications with C. elegans researchers. tRNAs
            are predicted using the program tRNAscan-SE (Lowe, T.M. and
            Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

  JOURNAL   Submitted (06-MAY-1998) Yasukazu Nakamura, Kazusa DNA Research
            Institute, Department of Plant Gene Research; 1532-3, Yana,
            Kisarazu, Chiba 292-0812, Japan (E-mail:ynakamu@kazusa.or.jp,
            Tel:81-438-52-3935, Fax:81-438-52-3934)
COMMENT     Address for correspondence: kaos@kazusa.or.jp
            For the latest information on annotation of this clone, please see
            http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=K18G13
            Genes with similarity to proteins in the databases are described in
            'product' or 'note' qualifiers.  Genes that have no significant
            protein similarity are described as 'unknown protein'.
            The software programs used to predict genes include: Grail
            (Informatics Group, Oak Ridge National Laboratory,
            http://compbio.ornl.gov/Grail-1.3/),
            GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
            NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
            Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
            SplicePredictor (Volker Brendel, Stanford University,
            http://gremlin1.zool.iastate.edu/cgi-bin/sp.cgi).
            Genes encoding tRNAs are predicted by tRNAscan-SE
            (Sean Eddy, Washington University School of Medicine, St. Louis,
            http://genome.wustl.edu/eddy/tRNAscan-SE/).
            This sequence may not be the entire insert of this clone. It may be
            shorter because we remove overlaps between neighboring submissions.
            The 5' clone is MJP23 and the 3' clone is MDK4.

COMMENT     Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University
                  St. Louis , MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 IRQ, England
                  email: submissions@watson.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted: all
            regions were double stranded, sequenced with an alternate chemistry
            or covered by high quality data (i.e., phred quality >= 30); an
            attempt was made to resolve all sequencing problems, such as
            compressions and repeats; all regions were covered by sequence from
            more than one m13 subclone.

            For a graphical representation of this clone sequence and its
            analysis see:
            http://www.wormbase.org/db/seq/sequence?name=F13H6;class=Sequence

                        NEIGHBORING CLONE INFORMATION

            The 5' clone is T28C12, 200 bp overlap; the 3' clone is F57F4, 200
            bp overlap. Actual start of this clone is at base position 1 of
            F13H6; actual end is at 9073 of F57F4.

            NOTES:

            Coding seqences below are the result of integration and manual
            review of the following data : computer analysis using the program
            Genefinder (P. Green and L. Hillier, personal communication), the
            large scale EST projects of Yuji Kohara
            (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C.
            elegans ORFeome cloning project (http://worfdb.dfci.harvard.edu/),
            similarity to other proteins from BlastX analyses
            (http://blast.wustl.edu/), sequence conservation with C. briggsae
            using Jim Kent's WABA alignment program (Genome Research
            10:1115-1125, 2000), individual C. elegans GenBank submissions,
            and personal communications with C. elegans researchers. tRNAs
            are predicted using the program tRNAscan-SE (Lowe, T.M. and
            Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

LOCUS       AY292861               31901 bp    DNA     linear   PLN 29-MAR-2004
DEFINITION  Boechera drummondii zing finger transcription factor PEI1 (PEI1),
            pollen specific glycine-rich protein GRP17 (GRP17), pollen specific
            glycine-rich protein GRP16 (GRP16), pollen specific glycine-rich
            protein GRP19 (GRP19), pollen specific glycine-rich protein GRP20
            (GRP20), transcription-factor-like protein (Bd5g07580), and WD
            repeat-like protein (Bd5g07590) genes, complete cds; and oleosin
            (Bd5g07600) and F box protein family (Bd5g07610) genes, partial
            cds.

AF309805
LOCUS       AF309805               32083 bp    DNA     linear   PLN 14-MAR-2001
DEFINITION  Pneumocystis carinii f. sp. carinii glutathione synthetase Gsh1
            (gsh1) gene, partial cds; putative a-factor pheromone receptor Ste3
            (ste3) gene, complete cds, alternatively spliced; and Ydr124wp-like
            protein, helix-loop-helix DNA binding protein, Yer049wp-like
            protein, protein kinase Ste20 (ste20), putative sucrose carrier
            Sca1 (sca1), putative Na+/H+ exchanger Nhx1 (nhx1), putative 26S
            protease regulatory subunit 4 (mts2), hypothetical protein, glycyl
            tRNA synthetase, and coiled-coil protein genes, complete cds.

            -------------- Genome Center
                Center: Washington University Genome Sequencing Center
                Center code: WUGSC
                Web site: http://genome.wustl.edu
                Contact: submissions@watson.wustl.edu
            -------------- Summary Statistics
                Center project name: H_AA008806F02
            --------------.

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            SOURCE INFORMATION:
            This fosmid was derived from a human female fosmid library.
            VECTOR: pepifos5

            NEIGHBORING SEQUENCE INFORMATION:
            This sequence is not the entire insert of the clone. This clone is
            overlapped by AC116645.

            Genetics, Washington University, St. Louis, MO 63110, USA. E-mail:
            worm@sanger.ac.uk
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            For a graphical representation of this sequence and its analysis
            see:- http://www.wormbase.org/perl/ace/elegans/seq/sequence?
            name=T05C12;class=Sequence
            IMPORTANT: This sequence is not the entire insert of clone T05C12.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone T05C12 is at 1 in this sequence. The
            true right end of clone T05C12 is at 4883 in
            sequence Z49968.
            The true left end of clone M110 is at 33681 in this sequence. The
            true right end of clone F10B5 is at 15182 in this sequence. The
            start of this sequence (1. .101) overlaps with the end of sequence
            Z48334.
            The end of this sequence (33681. .33780) overlaps with the start of
            sequence Z49968.

            -------------- Summary Statistics
                Center project name: H_NH0424M21
            --------------.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
```

as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc

SOURCE INFORMATION:
The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E., Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org
VECTOR: pBACe3.6

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the right is RP11-503L23, 2000 bp overlap. Actual start of this clone is at base position 1 of RP11-424M21; actual end is at base position 85936 of RP11-73G16.

There is a single plasmid subclone region from 14351 to 14470. Polymorphisms have been identified between AC107074 and AC044853. Data from AC044853 was used to finish this clone, AC107074.

COMMENT     Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University
                  St. Louis , MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 IRQ, England
                  email: submissions@watson.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted: all
            regions were double stranded, sequenced with an alternate chemistry
            or covered by high quality data (i.e., phred quality >= 30); an
            attempt was made to resolve all sequencing problems, such as
            compressions and repeats; all regions were covered by sequence from
            more than one m13 subclone.

            For a graphical representation of this clone sequence and its
            analysis see:
            http://www.wormbase.org/db/seq/sequence?name=F54D12;class=Sequence

                        NEIGHBORING CLONE INFORMATION

            The 5' clone is Y51H7D, 200 bp overlap; the 3' clone is Y51H7C, 200
            bp overlap. Actual start of this clone is at base position 1 of
            F54D12; actual end is at 38094 of F54D12.

            NOTES:

            Coding seqences below are the result of integration and manual
            review of the following data : computer analysis using the program
            Genefinder (P. Green and L. Hillier, personal communication), the
            large scale EST projects of Yuji Kohara
            (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C.
            elegans ORFeome cloning project (http://worfdb.dfci.harvard.edu/),
            similarity to other proteins from BlastX analyses
            (http://blast.wustl.edu/), sequence conservation with C. briggsae
            using Jim Kent's WABA alignment program (Genome Research
            10:1115-1125, 2000), individual C. elegans GenBank submissions,
            and personal communications with C. elegans researchers. tRNAs
            are predicted using the program tRNAscan-SE (Lowe, T.M. and
            Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

COMMENT     On Nov 21, 1995 this sequence version replaced gi:531770.
            Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            For a graphical representation of this sequence and its analysis
            see:- http://www.wormbase.org/perl/ace/elegans/seq/sequence?
            name=F35H8;class=Sequence
            IMPORTANT: This sequence is not the entire insert of clone F35H8.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone F35H8 is at 1 in this sequence. The true
            right end of clone F35H8 is at 96 in
            sequence Z47075.
            The true left end of clone E02H1 is at 14958 in this sequence. The
            true right end of clone AH6 is at 3246 in this sequence. The start
            of this sequence (1. .116) overlaps with the end of sequence Z48009.
            The end of this sequence (38288. .38383) overlaps with the start of
            sequence Z47075.

  TITLE     Direct Submission
  JOURNAL   Submitted (11-FEB-1998) European Drosophila Genome Sequencing
            Consortium
COMMENT     On Feb 1, 1998 this sequence version replaced gi:2653366.
            Sequence submitted by Takis Benos, EMBL Outstation - The EBI,
            Hinxton, Cambridge, CB10 1SD, U.K.
            E-mail: benos@ebi.ac.uk on behalf of the European Drosophila Genome
            Sequencing Consortium. For further information see the European
            Drosophila Genome Sequencing Consortium's web site:
            http://edgp.ebi.ac.uk/.
            Coding sequences are predicted from computer analysis, using both
            gene and CDS prediction programs and matches to other sequences.
            These predictions and matches have been evaluated by the annotators
            and may have been refined by hand. The annotators have also used
            their judgement on what matches to represent in this record. A far
            more complete annotation record is available from FlyBase
            (http://flybase.bio.indiana.edu/) through the FlyBase Annotation
            Object linked by the db_xref qualifier in the Feature Table.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            cosmid 17A9.  It may be shorter, since we are minimising the
            overlap between cosmids to 100 bases, by trimming them. The true
            left end of clone 17A9 is at position 19649 of clone 25D2
            Cosmid=17A9; Contig ID=17; Length=39582; Status=Finished.

            Tel:81-3-3599-8080, Fax:81-3-3599-8081)
COMMENT     This sequence is a seven transmembrane helix receptor candidate
            predicted from the whole human genome sequences using our automated
            system that contains programs of gene
            finding(GeneDecoder), sequence search, motif-domain assignment and
            transmembrane helix prediction.
            And the sequence is submitted by the collaborative project between
            [Computational Biology Research Center (CBRC), National Institute
            of Advanced Industrial Science and Technology (AIST)] and [Genome
            Science Division, Research Center for Advanced Science and
            Technology (RCAST), University of Tokyo].

LOCUS       AL845551               40374 bp    DNA     linear   VRT 16-APR-2005
DEFINITION  Zebrafish DNA sequence from clone XX-119C3 Contains 3 novel genes
            for alpha-type globins and one novel gene for a beta-type globin,
            complete sequence.
ACCESSION   AL845551
VERSION     AL845551.2  GI:23380956
KEYWORDS    HTG; globin; hemoglobin.
SOURCE      Danio rerio (zebrafish)
  ORGANISM  Danio rerio
            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
            Actinopterygii; Neopterygii; Teleostei; Ostariophysi;
            Cypriniformes; Cyprinidae; Danio.

  TITLE     Direct Submission
  JOURNAL   Submitted (02-DEC-2004) Wellcome Trust Sanger Institute, Hinxton,
            Cambridgeshire, CB10 1SA, UK. E-mail enquiries:
            zfish-help@sanger.ac.uk Clone requests:
            http://www.sanger.ac.uk/Projects/D_rerio/faqs.shtml#dataeight
COMMENT     On Sep 30, 2002 this sequence version replaced gi:22416327.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep XX-119C3 is from
            a Incyte Zebrafish AB BAC library VECTOR: pBeloBAC11
            Clone-derived Zebrafish pUC subclones occasionally display
            inconsistency over the length of mononucleotide A/T runs and
            conserved TA repeats. Where this is found the longest good quality
            representation will be submitted.

            Contact: zfish-help@sanger.ac.uk
            --------------
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one subclone; and the assembly was confirmed by restriction digest,
            except on the rare occasion of the clone being a YAC.
            Any regions longer than 1kb tagged as misc-feature 'unsure' are
            part of a tandem repeat of more than 10kb in length where it has
            not been possible to anchor the base differences between repeat
            copies.  The region has been built up based on the repeat element
            to match the total size of repeat indicated by restriction digest,
            but repeat copies may not be in the correct order and the usual
            finishing criteria may not apply.

  TITLE     Direct Submission
  JOURNAL   Submitted (28-DEC-1999) European Drosophila Genome Sequencing
            Consortium
COMMENT     Clone=140G11; Contig ID=26; Length=40933; Status=Finished Sequence
            submitted by Takis Benos, EMBL Outstation - The EBI, Hinxton,
            Cambridge, CB10 1SD, U.K.
            E-mail: benos@ebi.ac.uk on behalf of the European Drosophila Genome
            Sequencing Consortium. For further information see the European
            Drosophila Genome Sequencing Consortium's web site:
            http://edgp.ebi.ac.uk/.
            Coding sequences are predicted from computer analysis, using both
            gene and CDS prediction programs and matches to other sequences.
            These predictions and matches have been evaluated by the annotators
            and may have been refined by hand (in which case a Genefinder
            prediction will have no score. The annotators have also used their
            judgement on what matches to represent in this record. A far more
            complete annotation record is available from FlyBase
            (http://flybase.bio.indiana.edu/) through the FlyBase Annotation
            Object linked by the db_xref qualifier in the Feature Table.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            clone 140G11.  It may be shorter, since we are minimising the
            overlap between clones to 100 bases, by trimming them. Clone 140G11
            overlaps to the left with clone 163A10 This is the rightmost clone
            of its contig.
            The syntax for the representation of annotation used in this record
            is documented at:
            ftp://ftp.ebi.ac.uk/pub/databases/edgp/sequence_annotation.README.

COMMENT     On Aug 9, 2001 this sequence version replaced gi:1118107.
            Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University
                  St. Louis , MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 IRQ, England
                  email: submissions@watson.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted: all
            regions were double stranded, sequenced with an alternate chemistry
            or covered by high quality data (i.e., phred quality >= 30); an
            attempt was made to resolve all sequencing problems, such as
            compressions and repeats; all regions were covered by sequence from
            more than one m13 subclone.

            For a graphical representation of this clone sequence and its
            analysis see:
            http://www.wormbase.org/db/seq/sequence?name=C26B2;class=Sequence

                        NEIGHBORING CLONE INFORMATION

            The 5' clone is Y42H9B, 200 bp overlap; the 3' clone is C18F3, 200
            bp overlap. Actual start of this clone is at base position 1 of
            C26B2; actual end is at 41511 of C26B2.

            NOTES:

            Coding seqences below are the result of integration and manual
            review of the following data : computer analysis using the program
            Genefinder (P. Green and L. Hillier, personal communication), the
            large scale EST projects of Yuji Kohara
            (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C.
            elegans ORFeome cloning project (http://worfdb.dfci.harvard.edu/),
            similarity to other proteins from BlastX analyses
            (http://blast.wustl.edu/), sequence conservation with C. briggsae
            using Jim Kent's WABA alignment program (Genome Research
            10:1115-1125, 2000), individual C. elegans GenBank submissions,
            and personal communications with C. elegans researchers. tRNAs
            are predicted using the program tRNAscan-SE (Lowe, T.M. and
            Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

            GSF-Forschungszentrum fuer Umwelt und Gesundheit, GmbH,
            Ingolstaedter Landstrasse 1, D-85764 Neuherberg, FRG, E-mail:
            G.Mannhaupt@gsf.de Project Coordinator: Ulrich Schulte, Institute
            of Biochemistry, Heinrich-Heine-University, D-40225 Duesseldorf,
            E-mail: ulrich-schulte@uni-duesseldorf.de
COMMENT     BAC clone 12N19 (strain OR74A) is available at the Fungal Genetic
            Stock Center, http://www.fgsc.net
            Sequencing was performed by MWG Biotech AG, Ebersberg, Germany,
            http://www.mwgdna.com
            Information on performance of analysis and a more detailed
            annotation of this entry and other sequences of linkage groups II
            and V can be viewed at: http://mips.gsf.de/proj/neurospora.
